

Abstract

The invention relates to a contact protection housing for at least one electrical terminal that is disposed in a housing part (7) which is mounted on a component (1) and in which an opening (8) for introducing potting composition is made. The invention also relates to an injection pump, having a contact protection housing as described above, and to a method for mounting a contact protection housing, with an adapter.

To reduce the effort and expense of assembly, the housing part is formed by a thin-walled cap (7), whose edge rests constantly on the component (1) by initial tension.
